

**ATTACHMENT C: TESTING AND MONITORING PLAN  
40 CFR 146.90**

**Elk Hills 26R Storage Project**

**Facility Information**

Facility name: Elk Hills 26R Storage  
373-35R

Facility contact: Travis Hurst / Geological Advisor  
28590 Highway 119  
  
Tupman, CA 93276  
(661) 342-2409 / Travis.Hurst@crc.com

Well location: Elk Hills Oil Field, Kern County, CA  
35.32802963 / -119.5449982

This Testing and Monitoring Plan describes how Carbon TerraVault 1 LLC (CTV) will monitor the Elk Hills 26R storage site pursuant to 40 CFR 146.90. The monitoring data will be used to demonstrate that the well is operating as planned, the carbon dioxide plume and pressure front are moving as predicted, and that there is no endangerment to USDWs. In addition, the monitoring data will be used to validate and adjust the computational model used to predict the distribution of the CO<sub>2</sub> within the storage zone, supporting AoR re-evaluations and a non-endangerment demonstration.

Results of the testing and monitoring activities described below may trigger action according to the Emergency and Remedial Response Plan.

***Quality assurance procedures***

A quality assurance and surveillance plan (QASP) for all testing and monitoring activities, required pursuant to 146.90(k), is provided in the Appendix to this Testing and Monitoring Plan.

***Reporting procedures***

CTV will report the results of all testing and monitoring activities to the EPA in compliance with the requirements under 40 CFR 146.91.

### **Carbon Dioxide Stream Analysis [40 CFR 146.90(a)]**

CTV will analyze the CO<sub>2</sub> stream during the operation period to yield data representative of its chemical and physical characteristics and to meet the requirements of 40 CFR 146.90(a). Samples will be collected and analyzed quarterly, starting three months after the date of authorization of injection and every three months thereafter.

CTV is evaluating several sources of CO<sub>2</sub> as injectate for the project. Notification will be sent to the EPA prior to switching or adding CO<sub>2</sub> sources, at which time the sampling procedures can be reassessed.

#### ***Sampling location and frequency***

CO<sub>2</sub> injectate samples will be taken between the final compression stage and the wellhead. Sampling will take place three months after the date of authorization of injection and every three months thereafter.

CTV will increase the frequency and collect additional samples if the following occurs:

1. Significant changes in the chemical or physical characteristics of the CO<sub>2</sub> injectate, such as a change in the CO<sub>2</sub> injectate source; and
2. Facility or injector downtime is greater than thirty days.

#### ***Analytical parameters***

CTV will analyze the CO<sub>2</sub> for the constituents identified in Table 1 using the methods listed.

**Table 1. Summary of analytical parameters for CO<sub>2</sub> stream.**

<b>Parameter</b>	<b>Analytical Method(s)</b>
Oxygen	ASTM D1945
Nitrogen	ASTM D1945
Carbon Monoxide	ASTM D1945
Total hydrocarbons	ASTM D1945
Methane	ASTM D1945
Hydrogen Sulfide	ASTM D1945/D6228
CO <sub>2</sub> purity	ASTM D1945
Total Sulfur	ASTM 3246

### ***Sampling methods***

CO<sub>2</sub> stream sampling will occur in the last compressor station prior to being sent to the injector. A sampling station will be installed to facilitate collection of samples into a container. Sample containers will have a chain of custody form and will be labeled appropriately.

### ***Laboratory to be used/chain of custody and analysis procedures***

Samples will be sent to, and analysis conducted by, Zalco Laboratory (Zalco).

Zalco is a full-service laboratory in Bakersfield, 20 miles from the Elk Hills 26R Storage site. The laboratory has all the necessary equipment, experience, and certifications to complete the analysis. The detection limit and precision can be found in the QASP, Table 3.

Zalco has a chain of custody procedure that includes the following;

1. Sample date.
2. Sample description.
3. Sample type.
4. Relinquished by and received by signature.
5. Sampler name.
6. Location information.

## **Continuous Recording of Operational Parameters [40 CFR 146.88(e)(1), 146.89(b) and 146.90(b)]**

CTV will install and use continuous recording devices to monitor injection pressure, rate, and volume; the pressure on the annulus between the tubing and the long string casing; the annulus fluid volume added; and the temperature of the CO<sub>2</sub> stream, as required by 40 CFR 146.88(e)(1), 146.89(b), and 146.90(b).

### ***Monitoring location and frequency***

CTV will perform the activities identified in Table 2 to monitor operational parameters and verify mechanical integrity of the injection well. All monitoring will take place at the locations and frequencies shown in the table.

All monitoring will be continuous with a 30 second sampling and recording frequency for both active and shut-in periods.

**Table 2. Sampling devices, locations, and frequencies for continuous monitoring.**

<b>Parameter</b>	<b>Device(s)</b>	<b>Location</b>	<b>Min. Sampling Frequency</b>	<b>Min. Recording Frequency</b>
Injection pressure	Pressure Gauge	Surface and Downhole	30 seconds	30 seconds
Injection rate	Flowmeter	Surface	30 seconds	30 seconds
Injection volume	Calculated	Surface	30 seconds	30 seconds
Annular pressure	Pressure Gauge	Surface	30 seconds	30 seconds
CO <sub>2</sub> stream temperature	Temperature gauge	Surface and Downhole	30 seconds	30 seconds
<p>Notes:</p> <ul style="list-style-type: none"><li>• Sampling frequency refers to how often the monitoring device obtains data from the well for a particular parameter. For example, a recording device might sample a pressure transducer monitoring injection pressure once every two seconds and save this value in memory.</li><li>• Recording frequency refers to how often the sampled information gets recorded to digital format (such as a computer hard drive). For example, the data from the injection pressure transducer might be recorded to a hard drive once every minute.</li></ul>				

### ***Monitoring details***

#### **Injection Rate and Pressure Monitoring**

Injection pressure (gauge), temperature (gauge) and flow rate (flow meter) will be continuously monitored by the Elk Hills Central Command Facility (CCF). Injection rate and pressure limitations will be implemented to ensure adherence to the maximum allowable injection pressure of 90% of the injection zone's fracture pressure.

Pressure and temperature gauges will be calibrated as shown in QASP Table 6.

## Calculation of Injection Volume and Mass

The volume of CO<sub>2</sub> injected into the Monterey Formation 26R reservoir will be calculated from the injection flow rate, CO<sub>2</sub> density, and composition. Density will be determined from the Massachusetts Institute of Technology's CO<sub>2</sub> Thermophysical Calculator.

<https://sequestration.mit.edu/tools/index.html>

## Annular Pressure Monitoring

Annulus pressure is monitored continuously to ensure integrity of the down-hole packer and tubing. Pressure will be read at the surface via a pressure gauge. The annulus will be filled with a non-corrosive fluid. Any deviations in the annular pressure may indicate a well integrity issue that will be investigated.

## Injection Rate

The injection rate will be monitored with a Coriolis flowmeter. The meter will be calibrated for the expected flow rate range using accepted standards and will be accurate to within 0.1 percent.

## Corrosion Monitoring

To meet the requirements of 40 CFR 146.90(c), CTV will monitor well materials during the operation period for loss of mass, thickness, cracking, pitting, and other signs of corrosion to ensure that the well components meet the minimum standards for material strength and performance. CTV will monitor corrosion using corrosion coupons and collect samples according to the description below.

### *Monitoring location and frequency*

Monitoring will be conducted quarterly during the injection period, starting three months after injection begins and quarterly thereafter. Monitoring results will be documented and submitted to the EPA as per 40 CFR 146.91 (a)(7).

CTV will continually update the corrosion monitoring plan as data is acquired.

### *Sample description*

Samples of the materials used in the construction of the pipeline, and injection well that are exposed to CO<sub>2</sub> injectate will be monitored for corrosion using corrosion coupons. Representative materials (Table 3) will be weighed, measured, and photographed prior to installation.

**Table 3. List of equipment coupon with material of construction.**

Equipment Coupon	Material of Construction
Pipeline	CS A106B
Casing	N80 and K55 Steel

Equipment Coupon	Material of Construction
Tubing	13 CR L-80
Wellhead	Stainless steel

### ***Monitoring details***

The corrosion coupons will be located in the pipeline that feeds CO<sub>2</sub> injectate to the injectors. Every six months the coupons will be sent to a lab and photographed, measured, visually inspected, and weighed to a resolution of 0.1 milligram.

A corrosion rate of greater than 0.3 mils/year will initiate consultation with the regulatory agencies. In addition, a casing inspection log may be run to assess the thickness and quality of the casing if the corrosion rate exceeds 0.3 mils/year.

### **Above Confining Zone Monitoring**

CTV will monitor water quality and geochemical changes above the confining zone during the operation period to meet the requirements of 40 CFR 146.90(d).

Monitoring above the confining zone will include the following:

1. Tulare Formation – Upper Tulare Formation unsaturated zone will be monitored from the proposed Shallow Monitoring Well from 0 – 1,100 feet TVD.
2. Etchegoin Formation – between the confining layer and USDW in well 355X-26R.

### ***Monitoring location and frequency***

Table 4 shows the planned monitoring methods, locations, and frequencies for ground water quality and geochemical monitoring above the confining zone. Figure 1 shows the location for the monitoring well locations with respect to the AoR. The wells are located within the Elk Hills Oil Field, CTV owns the mineral rights and has guaranteed surface right access.

#### **Etchegoin Formation**

The Etchegoin Formation zone between the confining zone and Upper Tulare unsaturated zone will dissipate any CO<sub>2</sub> injectate that migrates upward through the confining zone. The Etchegoin will be monitored continuously for pressure and temperature changes. Leakage from the Monterey Formation to the Etchegoin Formation will increase the reservoir pressure.

The 355X-26R Etchegoin Formation monitor well is located in the middle of the AoR (Figure 1). The Etchegoin zone is continuous across the AoR. As such, 355X-26R will adequately monitor for pressure and temperature changes.

#### **Tulare Formation**

Monitoring in the Tulare Formation will include pressure and fluid sampling. Leakage to the Tulare Formation may increase the reservoir pressure and change the composition of the formation (increased CO<sub>2</sub> concentration).

Prior to injection a shallow Upper Tulare Formation monitoring well will be drilled and baseline analysis will be completed. Future results will be compared against these baseline results for significant changes or anomalies.

Additional shallow monitoring wells will be drilled to assess and monitor if the following occurs:

1. Etchegoin Formation monitoring well indicates increased pressure due to Monterey Formation 26R CO<sub>2</sub> injection.
2. Tulare Formation pressure or composition changes due to Monterey Formation 26R CO<sub>2</sub> injection.

**Table 4. Monitoring of ground water quality and geochemical changes above the confining zone.**

Target Formation	Monitoring Activity	Monitoring Location(s)	Frequency
Tulare Formation	Fluid Sampling	Shallow Monitoring Well	Annually
	Pressure/Temperature	Shallow Monitoring Well	Continuously
Etchegoin Formation	Pressure/Temperature	355X-26R	Continuously

**Figure 1: Above confining zone monitoring wells.**

### ***Analytical parameters***

Table 5 identifies the parameters to be monitored and the analytical methods CTV will use. Detection limits and precision are shown in QASP Table 3.

**Table 5. Summary of analytical and field parameters for ground water samples.**

<b>Parameters</b>	<b>Analytical Methods</b>
<b>Tulare Formation</b>	
Cations (Al, Ba, Mn, As, Cd, Cr, Cu, Pb, Se, Tl)	ICP-OEC EPA 200.7/6010B
Cations (Ca, Fe, K, Mg, Na, Si)	ICP-OEC EPA 200.7/6010B
Anions (Br, Ca, F, NO <sub>3</sub> , SO <sub>4</sub> )	Ion Chromatography, EPA Method 300.0
Dissolved CO <sub>2</sub>	SM 4500-CO <sub>2</sub> -C
Total Dissolved Solids	SM 2540 C
Alkalinity	SM 2320 B
pH (field)	EPA 150.1 / SM4500-H+B
Specific Conductance (field)	SM 2510 B
Temperature (field)	Thermocouple
Dissolved Methane	RSK-175/Gas Chromatography

### ***Sampling methods***

Samples will be collected using the following procedures:

1. Depth and elevation measurements for water level taken.
2. Wells will be purged such that existing water in the well is removed and fresh formation water is sampled.
3. Samples collected by lowering cleaned equipment downhole. Field measurements taken for pH, temperature, conductance, and dissolved oxygen.
4. Samples preserved and sent to lab as per chain of custody procedure.
5. Closure of well.

### ***Laboratory to be used/chain of custody procedures***

Samples will be sent to, and analysis conducted by Zalco, a full-service laboratory in Bakersfield, 20 miles from the Elk Hills 26R Storage site. The laboratory has all the necessary equipment,

experience, and certifications to complete the analysis. The detection limit and precision can be found in the QASP, Table 3.

Zalco has a chain of custody procedure that includes the following;

1. Sample date
2. Sample description
3. Sample type
4. Relinquished by and received by signature
5. Sampler name
6. Location information

### **External Mechanical Integrity Testing**

CTV will conduct at least one test periodically during the injection phase to verify external mechanical integrity as required at 146.89(c) and 146.90. MITs will be performed annually, within 30 days of the injection authorization date.

CTV will run a temperature log via wireline to ensure mechanical integrity of the tubing and downhole packer. If CTV elects to conduct an alternate MIT, notification that includes the test and a description will be sent to the EPA for approval.

### ***Testing location and frequency***

**Table 6. MITs.**

<b>Test Description</b>	<b>Location</b>
Temperature Log	Along wellbore via wireline well log
Radioactive Tracer	Along wellbore via iodine

### ***Testing details***

CTV will follow the following procedures for MIT temperature logging:

1. Stabilize injection for 24 hours prior to running the temperature log. If possible, the wireline speed will be limited to 20 feet per minute or less.
2. Run a temperature survey from 200 feet above the Reef Ridge Shale base to the deepest point reachable in the well, while injecting at a rate that allows for safe operations.

3. Shut-in well and run multiple temperature surveys with 1-2 hours between runs.
4. Assess the acquired time lapse temperature profiles. As the well cools, the temperature profile is compared to the baseline. External integrity issues present themselves anomalies when compared to the baseline.

### **Pressure Fall-Off Testing**

CTV will meet the requirements of 40 CFR 146.90(f) as discussed below.

#### ***Testing location and frequency***

The main benefit of pressure fall-off testing is to assess injectivity, reservoir flow boundary distances and reservoir pressures. CTV does not currently plan to complete pressure fall off testing. The Monterey Formation 26R reservoir is a depleted oil and gas reservoir with known reservoir continuity, boundaries, and flow properties from decades of water and gas injection. CTV may address scaling through time by acidizing the well to clean out the perforations.

CTV will consider pressure fall-off testing if injection rate decreases, with a simultaneous injection pressure increase outside the results from computational modeling.

#### ***Testing details***

The following procedure will be followed:

1. Injection rate will be held constant prior to shut-in. The injection rate will be high enough to produce a pressure buildup that will result in valid test data. The maximum operating pressure will not be exceeded.
2. Upon shutting-in the injector, surface and bottom-hole pressure and temperature measurements will be taken continuously. If there are offset injectors, rates will be held constant and recorded during the test.
3. The fall-off portion of the test will be conducted for a length of time sufficient that the pressure is no longer influenced by wellbore storage or skin.

Pressure sensors used for this test will be the wellhead gauges and a downhole gauge for the pressure falloff test. Each gauge will meet or exceed ASME B 40.1 Class 2A that provides 0.5% accuracy.

### **Carbon Dioxide Plume and Pressure Front Tracking**

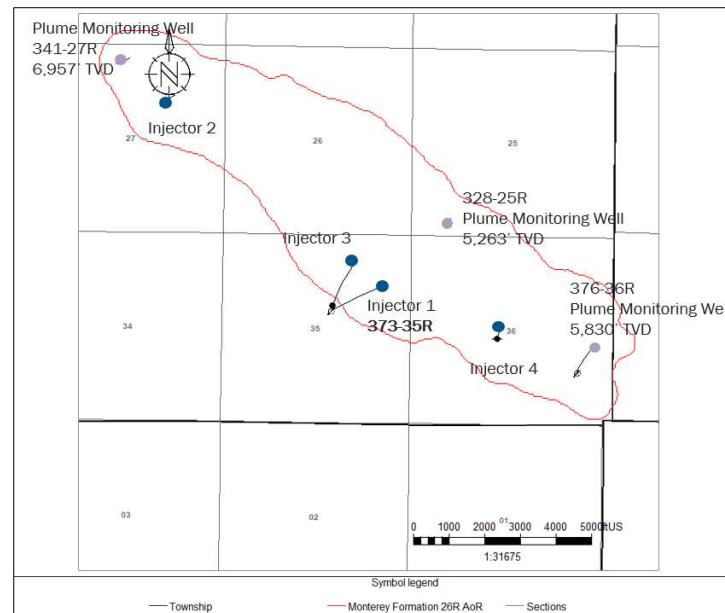

CTV will employ direct and indirect methods to track the extent of the carbon dioxide plume and the presence or absence of elevated pressure during the operation period to meet the requirements of 40 CFR 146.90(g).

### ***Plume monitoring location and frequency***

Table 7 presents the methods that CTV will use to monitor the position of the CO<sub>2</sub> plume, including the activities, locations, and frequencies. The parameters to be analyzed as part of fluid sampling in the injection zone and associated analytical methods are presented in Table 8. Quality assurance procedures for these methods are presented in SECTION B – DATA GENERATION AND ACQUISITION of the QASP.

Figure 2 shows the location and depth of the wells that will monitor the CO<sub>2</sub> plume directly in the targeted Monterey Formation 26R zone. These wells will actively monitor the development of the CO<sub>2</sub> plume upon the initiation of injection. If the plume development is not consistent with computation modeling results, CTV will assess whether additional monitoring of the plume is necessary.

**Figure 2: Monterey Formation 26R sequestration reservoir monitoring wells, with true vertical depth in feet of the monitoring interval.**

### ***Plume monitoring details***

Fluid sampling and pressure monitoring will be conducted for direct measurement of the plume. This will provide data on plume location but more importantly, the CO<sub>2</sub> content/concentration of the plume. The parameters to be analyzed for fluid sampling are presented in Table 8.

As discussed in the AoR and Corrective Action Plan, 72% of the post-shut-in injected CO<sub>2</sub> will remain as super-critical. Fluid samples will be taken, and CTV expects that there will be minor changes to pH, dissolved CO<sub>2</sub>, and formation fluid density.

Indirect plume monitoring will include pulse neutron logs (PNL) to understand CO<sub>2</sub> saturation changes through time. Prior to injection, a pulse neutron log will be run as a baseline. A PNL will be run on the monitoring wells every two years during the injection phase.

**Table 7. Plume monitoring activities.**

<b>DIRECT PLUME MONITORING</b>			
Monterey Formation 26R2	Fluid Sampling	341-27R, 328-25R and 376-36R	Annual
<b>INDIRECT PLUME MONITORING</b>			
Monterey Formation 26R	Pulse Neutron Logging	341-27R, 328-25R and 376-36R	Every two years from start of injection.

**Table 8. Summary of analytical and field parameters for fluid sampling in the injection zone.**

<b>Parameters</b>	<b>Analytical Methods</b>
<b>Tulare Formation</b>	
Cations (Al, Ba, Mn, As, Cd, Cr, Cu, Pb, Se, Tl)	ICP-OEC EPA 200.7/6010B
Cations (Ca, Fe, K, Mg, Na, Si)	ICP-OEC EPA 200.7/6010B
Anions (Br, Ca, F, NO <sub>3</sub> , SO <sub>4</sub> )	Ion Chromatography, EPA Method 300.0
Dissolved CO <sub>2</sub>	SM 4500-CO <sub>2</sub> -C
Total Dissolved Solids	SM 2540 C
Alkalinity	SM 2320 B
pH (field)	EPA 150.1 / SM4500-H+B
Specific Conductance (field)	SM 2510 B
Temperature (field)	Thermocouple
Dissolved Methane	RSK-175/Gas Chromatography

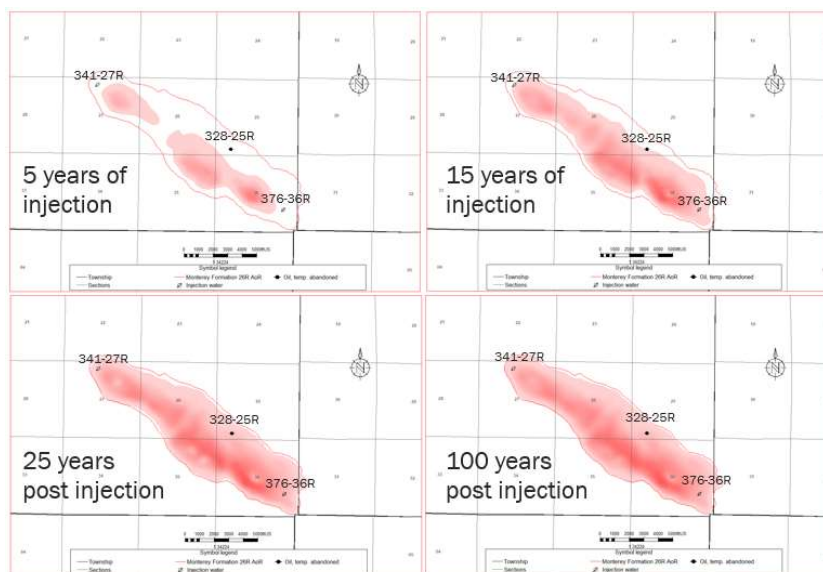

### ***Pressure-front monitoring location and frequency***

Table 9 presents the methods that CTV will use to monitor the position of the pressure front, including the activities, locations, and frequencies CTV will employ.

Quality assurance procedures for these methods are presented in SECTION B – DATA GENERATION AND ACQUISITION of the QASP.

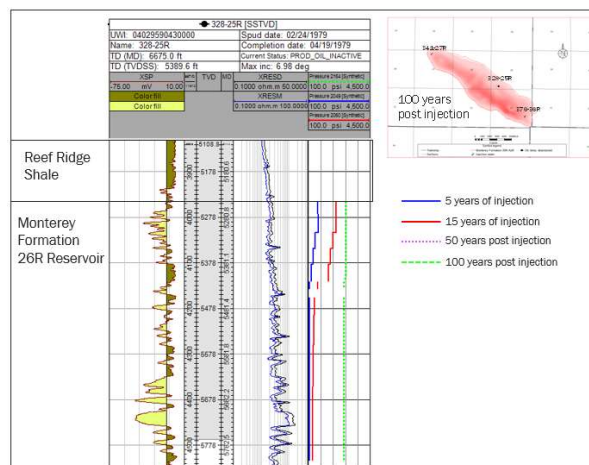

The aerial extent of plume development in the Monterey Formation 26R reservoir will reach the AoR boundaries early in the injection phase. Because the reservoir is pressure depleted, injected CO<sub>2</sub> will quickly fill the available pore space. Monitoring well locations with respect to plume development through time are shown in Figure 3.

**Figure 3: Monitoring well location with maps showing plume development through time from computational modeling.**

Monitoring well 328-25R pressure development based on computational is modeled in Figure 4. Note that the reservoir pressure between 50- and 100-years post injection is the same, indicating plume stabilization.

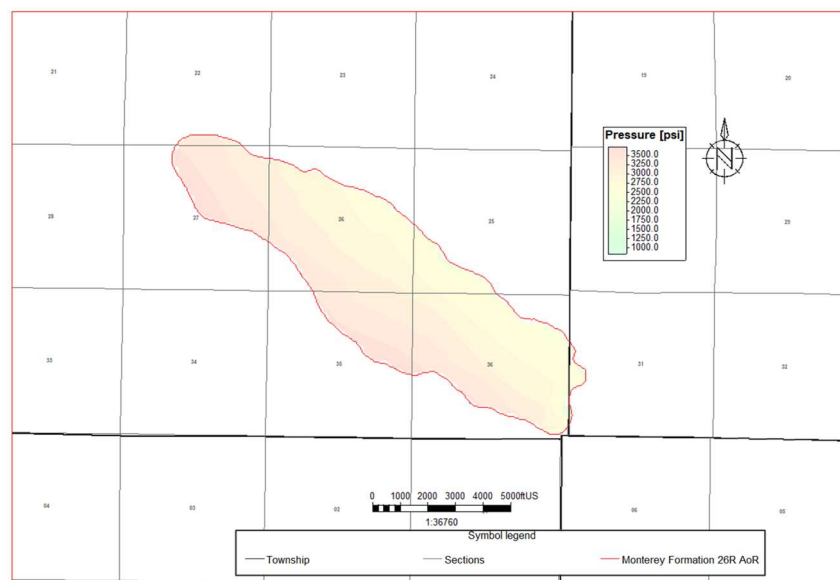

**Figure 4: Monitoring well 328-25R showing the pressure increase through time from the computational modeling results.**

### ***Pressure-front monitoring details***

Direct pressure monitoring of the plume will be achieved through installation of pressure gauges in monitoring wells 341-27R, 328-25R and 376-36R. The depleted Monterey Formation 26R oil and gas reservoir will be repressurized to the initial/discovery pressure of the reservoir. Figure 5 shows the pressure in the reservoir post injection. CTV will compare the pressure and rate increase from the computational model to the monitoring data to validate computational modeling results and identify operational discrepancies.

**Figure 5: Monterey Formation 26R pressure 50 years post injection. This reservoir pressure will be at or below the initial pressure at the time of discovery.**

The modeled pressure increases at monitoring well 328-25R are shown in Figure 4. Data acquired through monitoring will be compared to results from computational modeling to ensure suitable definition of the AoR and plume.

**Table 9. Pressure-front monitoring activities.**

Target Formation	Monitoring Activity	Monitoring Location(s)	Frequency
<b>DIRECT PRESSURE-FRONT MONITORING</b>			
Monterey Formation 26R	Pressure and temperature monitoring	341-27R, 328-25R and 376-36R	Continuous
<b>INDIRECT PRESSURE-FRONT MONITORING</b>			
All formations	Seismicity	AoR	Continuous

### **Induced Seismicity and Fault Monitoring**

CTV will monitor seismicity with surface and shallow borehole seismometers in the AoR. The seismometers will be tied in with the regional network to increase resolution and assess natural versus induced seismicity. The seismometers will be able to detect events with a magnitude 0 to 1.0 and will be installed pre-injection to provide baseline seismicity. In addition, CTV will monitor the Southern California Earthquake Data Center (SCEDC) network for seismic events.

#### **Appendix: Quality Assurance and Surveillance Plan**

See Quality Assurance and Surveillance Plan
